Researches are focused mainly on
multidimensional data visualization

Researches are focused mainly on multidimensional data visualization

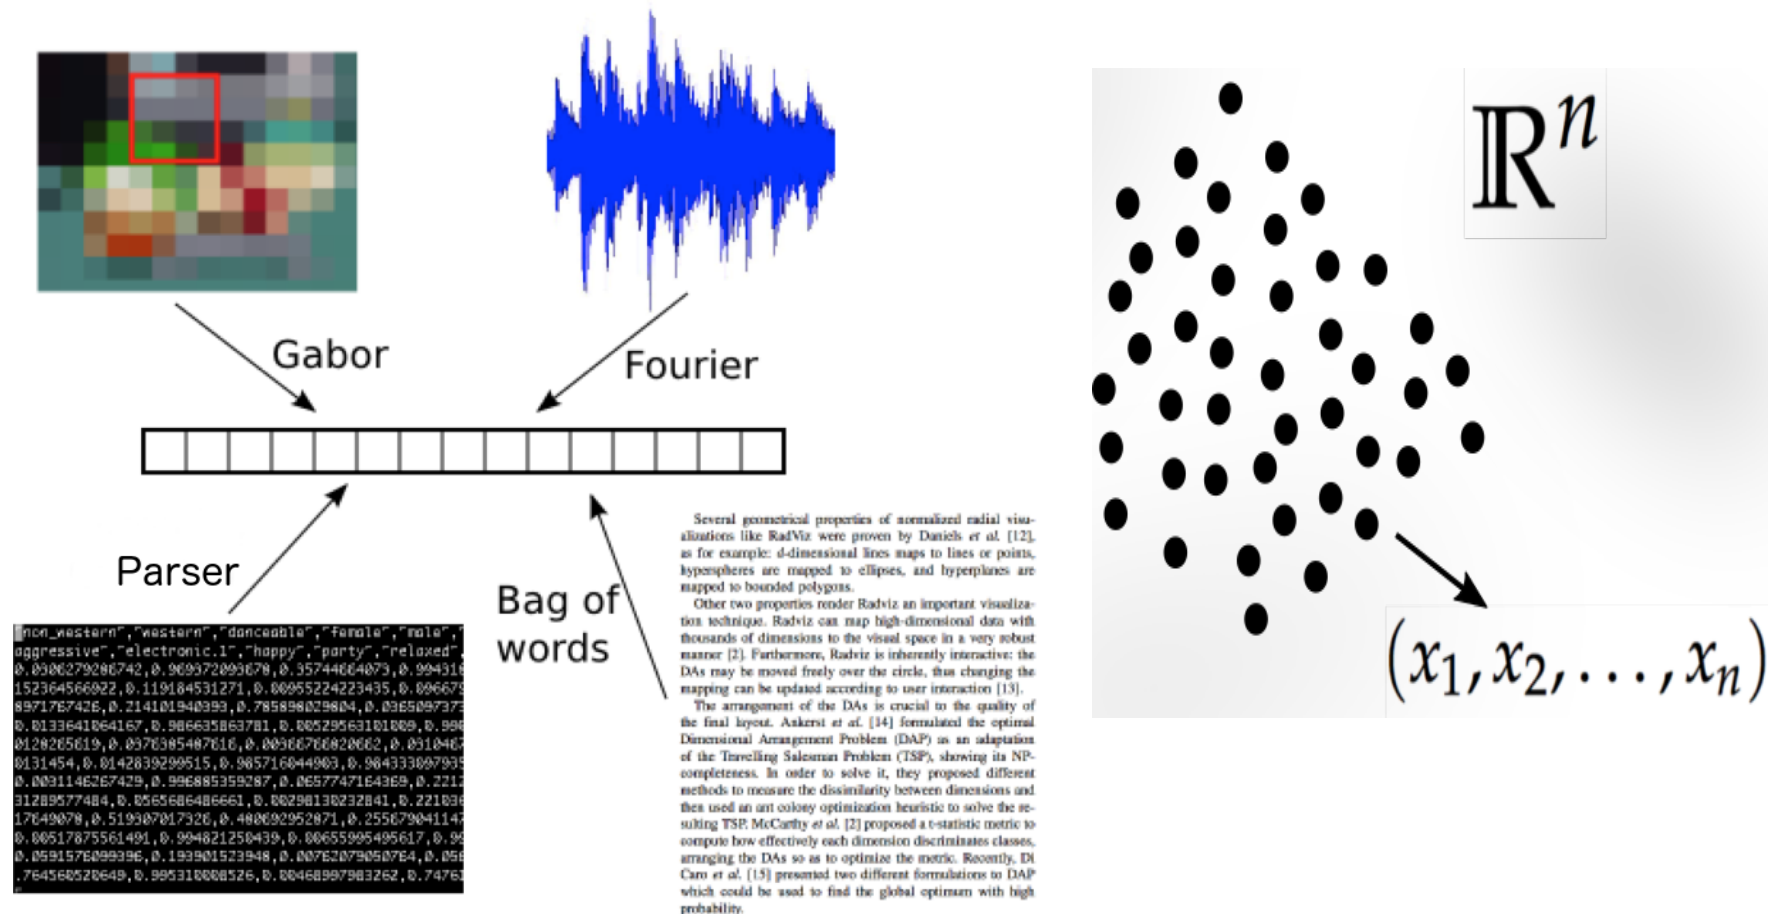

Several geometrical properties of normalized radial visualizations like RadViz were proven by Daniels et al. [12], as for example: d -dimensional lines maps to lines or points, hyperspheres are mapped to ellipses, and hyperplanes are mapped to bounded polygons.

Other two properties render RadViz an important visualization technique. RadViz can map high-dimensional data with thousands of dimensions to the visual space in a very robust manner [2]. Furthermore, RadViz is inherently interactive: the DAs may be moved freely over the circle, thus changing the mapping can be updated according to user interaction [13].

The arrangement of the DAs is crucial to the quality of the final layout. Ankerst et al. [14] formulated the optimal Dimensional Arrangement Problem (DAP) as an adaptation of the Travelling Salesman Problem (TSP), showing its NP-completeness. In order to solve it, they proposed different methods to measure the dissimilarity between dimensions and then used an ant colony optimization heuristic to solve the resulting TSP. McCarthy et al. [2] proposed a t-statistic metric to compute how effectively each dimension discriminates classes, arranging the DAs so as to optimize the metric. Recently, Di Caro et al. [15] presented two different formulations to DAP which could be used to find the global optimum with high probability.

Researches are focused mainly on multidimensional data visualization

Two main topics:

- Multidimensional Projection based Visual Analytics
- Graph based Time-Varying data Visual Analytics

Two main topics:

- Multidimensional Projection based Visual Analytics
 - ✓ Supervised Projection Methods
 - ✓ Distortion Analysis
 - ✓ Enriched MP Layout
- Graph based Time-Varying data Visual Analytics

Two main topics:

 - ✓ Graph-Wavelets
 - ✓ Multi-way Arrays (tensor decomposition)

Multidimensional Projection

Multidimensional Projection

Multidimensional Projection techniques aim to embed instances of data in a Cartesian k -dimensional space assuming that a (dis)similarity measure between pairs of instances is known.

Multidimensional Projection

Multidimensional Projection techniques aim to embed instances of data in a Cartesian k -dimensional space assuming that a (dis)similarity measure between pairs of instances is known.

$d(\text{img}_1, \text{img}_2)$

Multidimensional Projection

Multidimensional Projection techniques aim to embed instances of data in a Cartesian k -dimensional space assuming that a (dis)similarity measure between pairs of instances is known.

Multidimensional Projection @ ICMC

- Pioneered supervised MP methods
- First to propose a local MP method

Multidimensional Projection @ ICMC

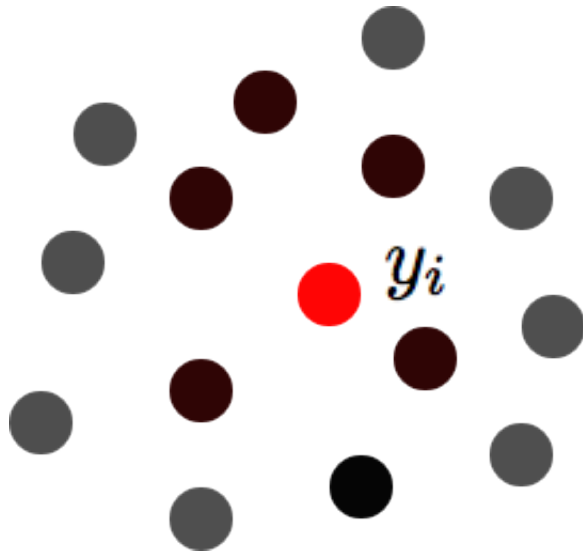

- Pioneered user driven MP methods
- First to propose a local MP method
 - ✓ Least Square Projection (LSP)
 - ✓ Local Affine Multidimensional Projection (LAMP)

Least Square Projection - LSP

Least Square Projection - LSP

LSP has been tailored to be interactive (supervised), enabling users to steer the projection process.

Multidimensional Space

$$y_i = \sum_{j \in N_i} \alpha_{ij} y_j \quad \alpha_{ij} = \frac{1}{|N_i|}$$

A tenable assumption is that neighborhoods should be preserved in the visual space:

$$x_i = \sum_{j \in N_i} \alpha_{ij} x_j \quad \longrightarrow \quad x_i - \sum_{j \in N_i} \alpha_{ij} x_j = 0$$

A tenable assumption is that neighborhoods should be preserved in the visual space:

$$x_i = \sum_{j \in N_i} \alpha_{ij} x_j \quad \longrightarrow \quad x_i - \sum_{j \in N_i} \alpha_{ij} x_j = 0$$

$$Lx^1 = 0 \quad Lx^2 = 0$$

$$L_{ij} = \begin{cases} 1 & i = j, \\ -\alpha_{ij} & x_j \in N_i, \\ 0 & \text{otherwise} \end{cases}$$

A tenable assumption is that neighborhoods should be preserved in the visual space:

$$x_i = \sum_{j \in N_i} \alpha_{ij} x_j \quad \longrightarrow \quad x_i - \sum_{j \in N_i} \alpha_{ij} x_j = 0$$

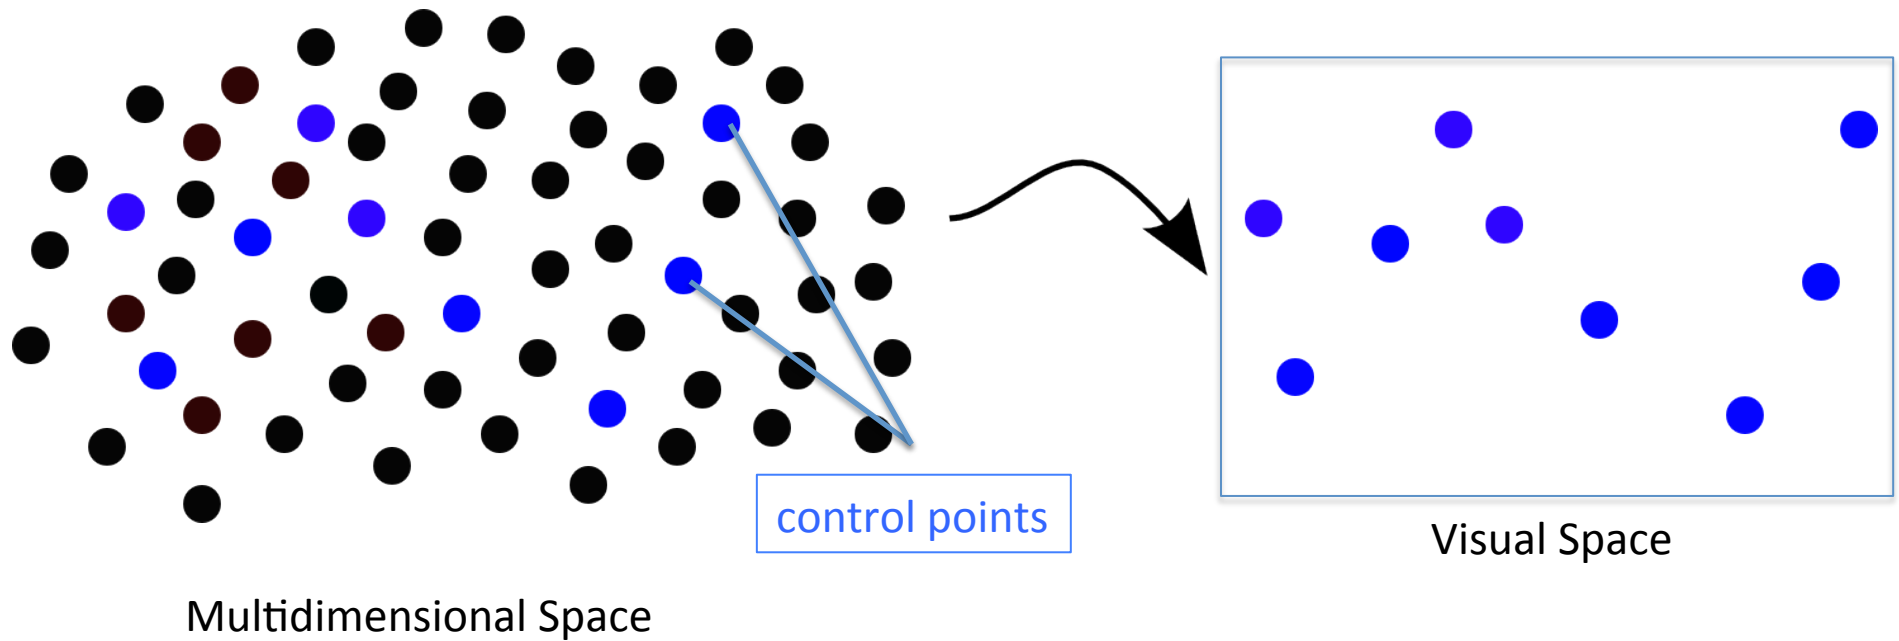

$$Lx^1 = 0 \quad Lx^2 = 0$$

Laplace systems:
constraints are need to
ensure non-trivial solution

$$L_{ij} = \begin{cases} 1 & i = j, \\ -\alpha_{ij} & x_j \in N_i, \\ 0 & \text{otherwise} \end{cases}$$

Constraints for the homogeneous systems are given by control points in the visual, which can be interactively displaced to steer the projection process.

Constraints for the homogeneous systems are given by control points in the visual, which can be interactively displaced to steer the projection process.

Unsupervised

User Driven

Although LSP allows for user interaction it has two main drawbacks:

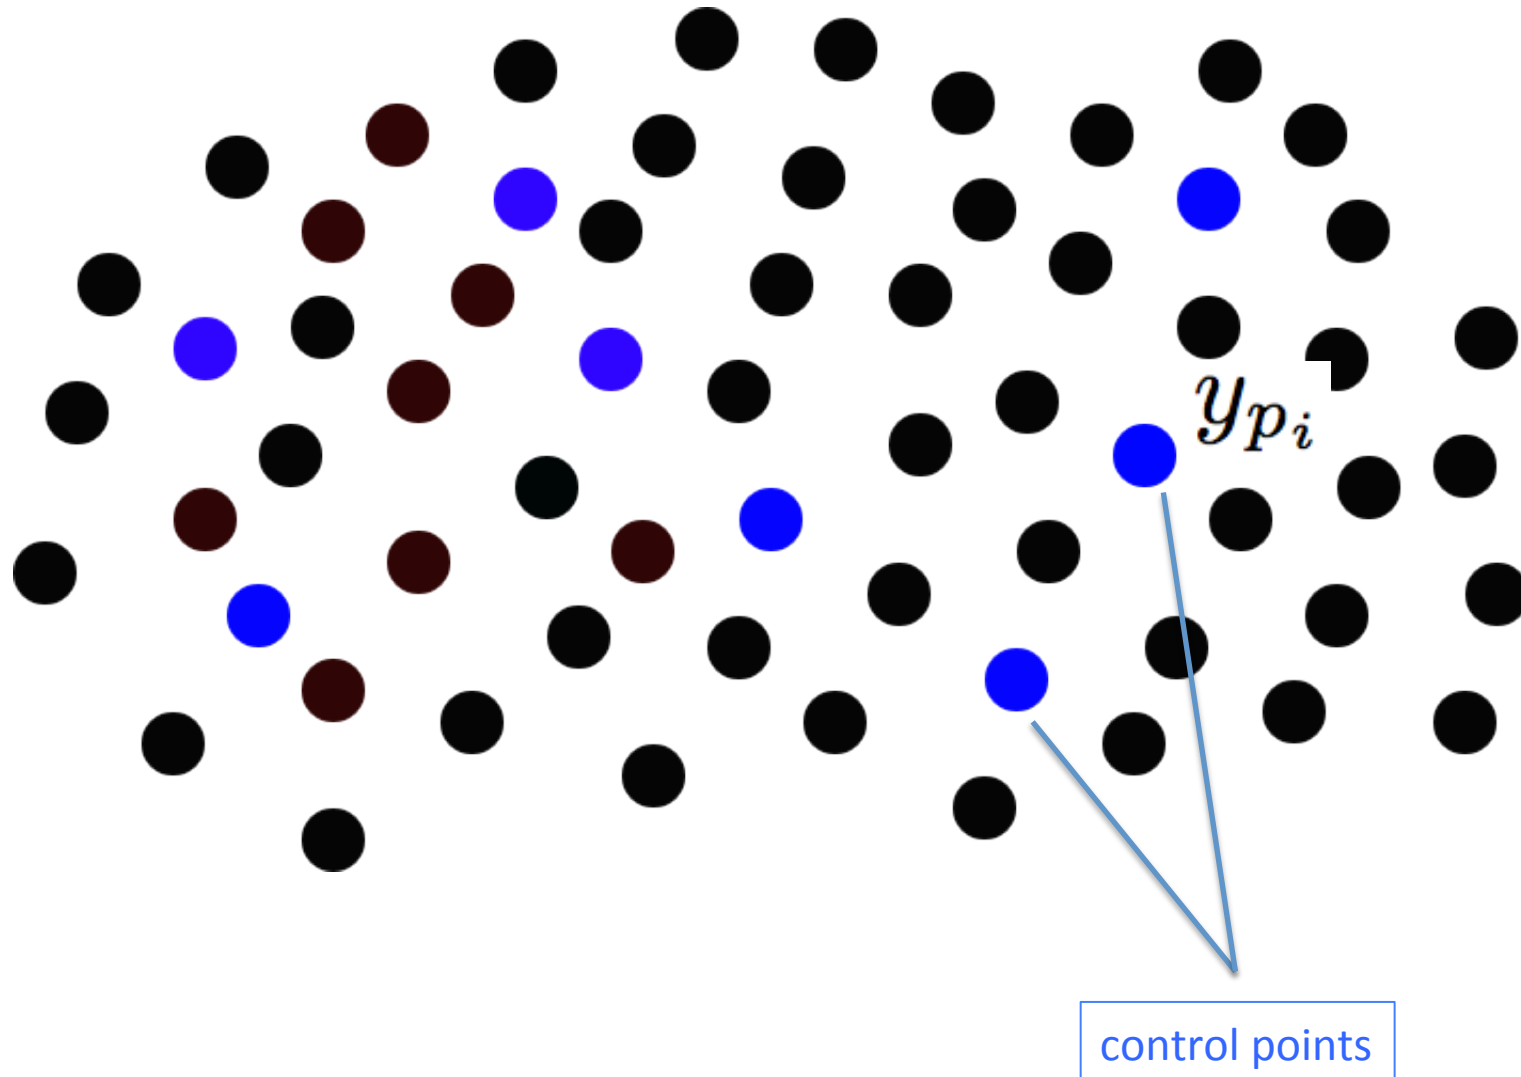

1. LSP is not super fast
can not handle massive data sets
2. LSP mapping is global
small changes in the control points affects the whole layout

Local Affine Multidimensional Projection (LAMP)

Local Affine Multidimensional Projection (LAMP)

LAMP has been designed to be local,
interactive, and computationally efficient.

Multidimensional space

Multidimensional space

Each point is mapped to the visual space using its own affine transformation

$$f_y(y_i) = y_i M + t$$

Multidimensional space

Each point is mapped to the visual space using its own affine transformation

$$f_y(y_i) = y_i M + t$$

$$\sum_i w_i \|\hat{y}_{p_i} M - \hat{x}_{p_i}\|^2 \quad \text{subject to } M^\top M = I$$

$$\|AM - B\|_F, \quad \text{subject to } M^\top M = I$$

$$A = \begin{bmatrix} \sqrt{w_1} \hat{y}_{p_1} \\ \sqrt{w_2} \hat{y}_{p_2} \\ \vdots \\ \sqrt{w_s} \hat{y}_{p_s} \end{bmatrix} \quad B = \begin{bmatrix} \sqrt{w_1} \hat{x}_{p_1} \\ \sqrt{w_2} \hat{x}_{p_2} \\ \vdots \\ \sqrt{w_s} \hat{x}_{p_s} \end{bmatrix}$$

(a) 10%.

(j) LAMP.

(k) LSP.

Point-based layouts allow to visualize neighborhood relation and well defined clusters.

Point-based layouts allow to visualize neighborhood relation and well defined clusters.

However, information such as:

- which are the content of the data in each region?
- which are the most relevant attributes in each region?

can not directly be obtained from the layout.
