| Introduction<br>●○○○○○ | The problem | Existence for every $\mu$ $\odot$ | Nonexistence | Bibliography | References |
|------------------------|-------------|-----------------------------------|--------------|--------------|------------|
| Purpose                |             |                                   |              |              |            |

We consider the problem

$$\begin{cases} (-\Delta)^k u = \lambda f(x, u) + \mu g(x, u) & \text{in } \Omega, \\ u > 0 & \text{in } \Omega, \\ (-\Delta)^i u = 0 & \text{on } \partial\Omega, \quad i = 0, ..., k - 1, \end{cases}$$

where

- $\Omega \subset \mathbb{R}^N$  bounded smooth domain,
- $\lambda, \mu \geq 0$  are two parameters,
- f, g are nonnegative functions,
- $k \in \mathbb{N}$ .

**Purpose**: to obtain multiplicity of positive solutions, in particular when the nonlinearity has zeros.

|                        |             |                             |              |              |            |

If we consider the nonautonomous case h(x, u), then the zero may be a function a(x): model:  $h(u) = u^q |a(x) - u|^r$ ,  $1 < r + q < 2^*$ ,  $q \in (0, 1]$ We considered this case in (Iturriaga, Massa, Sánchez, and Ubilla, 2010), assuming a(x) is superharmonic and  $0 < a_0 \le a(x) \le A_0$ . (Then a(x) is still a supersolution)

Also, some related works:

• in (Iturriaga, Lorca, and Massa, 2010) we considered supercritical problems,

•in (Iturriaga, Massa, Sanchez, and Ubilla, 2014) a similar problem on an annulus,

• in (Iturriaga, Lorca, and Massa, 2017) we considered multiple zeros and more possible behaviors near the origin.

| Introduction | The problem<br>●○○○○○ | Existence for every $\mu$ O | Nonexistence | Bibliography | References |
|--------------|-----------------------|-----------------------------|--------------|--------------|------------|
| The pr       | oblem                 |                             |              |              |            |

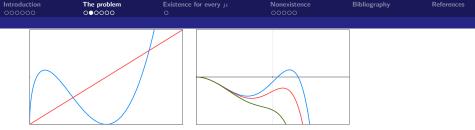

We start by considering the following problem:

$$\begin{cases} (-\Delta)^k \ u = \lambda h(x, u) & \text{in } \Omega, \\ u > 0 & \text{in } \Omega, \\ (-\Delta)^i u = 0 & \text{on } \partial\Omega, \ i = 0, .., k - 1, \end{cases}$$
(2.1)

- Here we have no sub and supersolution method.
- We try a purely variational approach: consider

$$J_{\lambda}: \mathbb{H} \to \mathbb{R}: u \mapsto J_{\lambda,\mu}(u) = rac{1}{2} \|u\|_{\mathbb{H}}^2 - \lambda \int_{\Omega} H(x, u^+).$$

 $\mathbb{H} = \{ u \in H^k(\Omega) \text{ such that } (-\Delta)^i u = 0 \text{ on } \partial\Omega, \ i = 0, .., [(k-1)/2], \},$ 

• there exists  $u_0 \in \mathbb{H}$  such that, for every  $\lambda > 0$  there exists  $t_0(\lambda) > 0$ such that one has  $J_{\lambda}(tu_0) < 0$  for  $0 < t < t_0(\lambda)$ • there exists  $e \in \mathbb{H}$  such that, for any  $\lambda \ge 0$  $J_{\lambda}(te) \to -\infty$  when  $t \to +\infty$ . • We need something like: — given  $\lambda > 0$  and  $H \in \mathbb{R}$ , there exist  $\rho_H(\lambda) > 0$  such that

 $J_{\lambda}(u) > H \qquad \text{for } \|u\|_{\mathbb{H}} = \rho_{H}(\lambda). \tag{2.2}$ 

The presence of the zero is not enough to guarantee this!

• there exists  $u_0 \in \mathbb{H}$  such that, for every  $\lambda > 0$  there exists  $t_0(\lambda) > 0$ such that one has  $J_{\lambda}(tu_0) < 0$  for  $0 < t < t_0(\lambda)$ 

ullet there exists  $e\in\mathbb{H}$  such that, for any  $\lambda\geq0$ 

 $J_{\lambda}(te) \rightarrow -\infty$  when  $t \rightarrow +\infty$ .

• We need something like:

— given  $\lambda > 0$  and  $H \in \mathbb{R}$ , there exist  $\rho_H(\lambda) > 0$  such that

$$J_{\lambda}(u) > H \qquad \text{for } \|u\|_{\mathbb{H}} = \rho_{H}(\lambda). \tag{2.2}$$

The presence of the zero is not enough to guarantee this!

• there exists  $u_0 \in \mathbb{H}$  such that, for every  $\lambda > 0$  there exists  $t_0(\lambda) > 0$ such that one has  $J_{\lambda}(tu_0) < 0$  for  $0 < t < t_0(\lambda)$ 

ullet there exists  $e\in\mathbb{H}$  such that, for any  $\lambda\geq0$ 

 $J_{\lambda}(te) \rightarrow -\infty$  when  $t \rightarrow +\infty$ .

• We need something like:

# The existence of two solutions result

- $f,g:\overline{\Omega}\times [0,+\infty)\longrightarrow [0,+\infty)$  are Carathéodory functions and satisfy
  - f(x,0) = g(x,0) = 0,
  - $\bullet\,$  conditions at  $\infty$  for PS condition,
  - local (sublinearity) condition at the origin:

 $\lim_{t\longrightarrow 0^+} \frac{f(x,t)}{t} = +\infty \quad \text{uniformly in } x \in \omega \subset \subset \Omega,$ 

• local (superlinearity) condition at infinity :  $\lim_{t \to +\infty} \frac{g(x,t)}{t} = +\infty \quad \text{uniformly in } x \in \omega_2 \subset \subset \Omega.$ 

Then: there exists a function  $M : (0, \infty) \to (0, \infty]$  such that the problem  $(P_{\lambda,\mu}^k)$ ,  $k \in \mathbb{N}$ , has at least two positive solutions for  $\lambda > 0$  and  $0 < \mu < M(\lambda)$ .

A similar result for k = 1 is obtained in (de Figueiredo, Gossez, and Ubilla, 2003) "Local superlinearity and sublinearity for indefinite semilinear elliptic problems"

# The existence of two solutions result

- $f,g:\overline{\Omega}\times [0,+\infty)\longrightarrow [0,+\infty)$  are Carathéodory functions and satisfy
  - f(x,0) = g(x,0) = 0,
  - $\bullet\,$  conditions at  $\infty$  for PS condition,
  - local (sublinearity) condition at the origin:

 $\lim_{t\longrightarrow 0^+} \frac{f(x,t)}{t} = +\infty \quad \text{uniformly in } x \in \omega \subset \subset \Omega,$ 

• local (superlinearity) condition at infinity :  $\lim_{t \to +\infty} \frac{g(x,t)}{t} = +\infty \quad \text{uniformly in } x \in \omega_2 \subset \subset \Omega.$ 

Then: there exists a function  $M : (0, \infty) \to (0, \infty]$  such that the problem  $(P_{\lambda,\mu}^k)$ ,  $k \in \mathbb{N}$ , has at least two positive solutions for  $\lambda > 0$  and  $0 < \mu < M(\lambda)$ .

"There exists a function  $M : (0, \infty) \to (0, \infty]$  such that the problem  $(P_{\lambda,\mu}^k)$ ,  $k \in \mathbb{N}$ , has at least two positive solutions for  $\lambda > 0$  and  $0 < \mu < M(\lambda)$ ."

#### Question

Is this bound on  $\mu$  really necessary?

Actually

• in (Iturriaga, Massa, Sánchez, and Ubilla, 2010) there is no bound:  $M(\lambda) \equiv \infty$ ,

• because of the zero, the necessary condition for existence is always satisfied (two intersections!)

Then we investigate when  $M(\lambda) = \infty$  or  $M(\lambda) < \infty$ .

We can prove that  $M(\lambda) = \infty$  if "the first solution has a suitable neighborhood below a(x)". This is true for example:

- 1. in the (Iturriaga, Massa, Sánchez, and Ubilla, 2010) situation: k = 1, a(x) supersolution.
- 2. for k = 1, small  $\lambda$ ,  $a(x) \ge a_0 > 0$ .
- 3. for k > 1, small  $\lambda$ ,  $a(x) \ge a_0 > 0$  and N < 2k.

1. the solution is below the supersolution,

- 2. by regularity theory, the solution is below  $a_0$ ,
- 3. by the regularity of functions in  $\mathbb{H}$ , the solution is below  $a_0$ .

On the other hand, in some cases  $M(\lambda) < \infty$ , in particular, no positive solution exists for large  $\mu$ .

We assume N = 1, with  $\Omega = (-1, 1)$ , and

• The functions  $f,g:\overline{\Omega}\times[0,+\infty)\longrightarrow[0,+\infty)$  are continuous functions and satisfy

• 
$$f(x,0) = g(x,0) = 0$$
,

- condition (Z), with  $a(x) \in C(\overline{\Omega})$ .
- g(x, t) > 0 for t > a(x).

•  $f(x, \tau t) > \tau f(x, t) > 0$  for every  $x \in \Omega$ ,  $\tau \in (0, 1)$ ,  $t \in (0, a(x))$ .

• There exists  $b_0, c_0 > 0$  such that, uniformly in  $x \in \Omega$ ,

$$\liminf_{t\to 0^+} \frac{f(x,t)}{t} \ge b_0, \qquad \liminf_{t\to +\infty} \frac{g(x,t)}{t} \ge c_0$$

## We obtain

# Theorem If • $k \ge 2$ and a(x) satisfies $\lim_{x\to\pm 1} a(x) = a^{\pm} > 0$ and a' exists and is bounded near $\pm 1$ , or • $k \in \mathbb{N}$ and a(x) is not a concave function, then there exists $\Lambda_1 > 0$ and $N : (\Lambda_1, \infty) \to (0, \infty)$ such that problem

 $(P_{\lambda,\mu}^k)$  has no positive solution for  $\lambda > \Lambda_1$  and  $\mu > N(\lambda)$ .

| Introduction | The problem | Existence for every $\mu$ O | Nonexistence<br>○○●○○ | Bibliography | References |
|--------------|-------------|-----------------------------|-----------------------|--------------|------------|
|              |             |                             |                       |              |            |

Idea of the proof: one first proves (using Green function and the concavity of the solutions  $u_{\lambda,\mu}$ )

#### Lemma

(1) for every 
$$p \in \Omega$$
,  $\liminf_{\lambda \to \infty} u_{\lambda,\mu}(p) \ge a(p)$ , uniformly in  $\mu \ge 0$ .

(2) for every 
$$p \in \Omega$$
,  $\limsup_{\mu \to \infty} u_{\lambda,\mu}(p) \le a(p)$ , uniformly in  $\lambda \ge 0$ .

Then one obtains a contradiction:

- since  $u_{\lambda,\mu}$  is concave, in can not approximate a non-concave function
- if k ≥ 2, u<sub>λ,μ</sub> cannot satisfy the boundary condition and approximate a since lim<sub>x→±1</sub> a(x) = a<sup>±</sup> > 0.

# Comparison in the model case

In particular, for the model autonomous problem in dimension N = 1 $\begin{cases}
f(x, u) = (u^+)^q [(a - u)^+]^p, & q \in (0, 1), p > 1, \\
g(x, u) = [(u - a)^+]^r, & r > 1:
\end{cases}$ 

- if k=1 then  $M(\lambda)\equiv\infty$  (<sup>2</sup>): two solutions for every  $\lambda,\mu>0$
- if  $k \ge 2$  then
  - $M(\lambda) \equiv \infty$  for small  $\lambda$
  - $M(\lambda) < \infty$  for large  $\lambda$

for the model problem in dimension N = 1 with non-concave  $a(x) \ge a_0 > 0,$   $\begin{cases}
f(x, u) = (u^+)^q [(a(x) - u)^+]^p, & q \in (0, 1), p > 1, \\
g(x, u) = [(u - a(x))^+]^r, & r > 1:
\end{cases}$ • for any  $k \in \mathbb{N}$ , •  $M(\lambda) \equiv \infty$  for small  $\lambda$ •  $M(\lambda) < \infty$  for large  $\lambda$
